

ADM: Supervised In-Plant Alarm & Communication System

Tough Phone utilized 25 years of industrial plant experience when designing the ADM system. The microprocessor based system is designed to address all communication, supervision and notification third party requirements.

ADM field stations employ the latest technology in data communications to significantly improve system integrity and functionality. By interconnecting with the ADM controller, the field stations exchange fault and activity information.

The ADM control station display provides a graphic visualization of the entire communication system.

Circuit faults are displayed to assist maintenance personnel in locating non-operating field stations.

Additional system functions monitored by the control station are: page line usage, cable integrity and status of field station amplifiers and loudspeakers.

The ADM system provides secure alarm notification and centralized diagnostics.
